

Piracy and PIPA/SOPA

This is our final project for Decision Making Under Uncertainty

April 25, 2026

Abstract

We need to put something here which gives an abstract description
of what we did and why it matters

Contents

Introduction	2
Project Motivation	2
Data Source and Variables	2
Research Questions and Hypothesis	2
Research Question	2
Our Hypothesis	2
Main Analyses	3
Exploratory Data Analysis	3
Statistical Methods	3
Discussion (Interpretation, uncertainty, assumptions)	3
Conclusion (final answer, limitations, future work, why it matters)	4
Summary of Findings	4
Limitations and Future Work	4

Introduction

Give a brief introductory paragraph on the project.

Project Motivation

Questions to Answer:

- Why do we care?
- What are we doing?
- Briefly, how are we solving it?
- What is the data?
- Where does it come from?

Data Source and Variables

More in-depth overview about the data

- Population vs Sample
- Size:
 - How many observations?
 - How many variables?
- Variables - describe each variable in the dataset (more than just it's type)

Research Questions and Hypothesis

Give a brief introductory paragraph on this section.

Research Question

- Define our primary question that our analysis will answer
- Describe how we came up with this question

Our Hypothesis

- State null & alternative hypotheses in english
- Then describe them in statistics language (i.e. symbols)
- List 2-3 supporting questions we will investigate

Main Analyses

Briefly describe this section.

Exploratory Data Analysis

Give an overview of the plots we use & statistics we used and relate how they answer our research questions.

Describe the plot and how it helps answer a research question

PLOT 1 - PLOT 1 figcaption

Describe the plot and how it helps answer a research question

PLOT 2 - PLOT 2 figcaption

Describe the plot and how it helps answer a research question

PLOT 3 - PLOT 3 figcaption

Statistical Methods

List the statistical analysis methods we used to answer our research question.

- Go through each method in separate sections
 - describe how each method answers one of our research question
 - explain the results of the particular analysis
 - define the analysis in proper statistics notation (i.e. with symbols)

Discussion (Interpretation, uncertainty, assumptions)

can merge this section into conclusion if we need to shorten the report

Briefly interpret the results beyond the raw statistics.

- What do the results imply?
- Were the hypotheses supported?
- How should we understand the uncertainty?
- What assumptions did the analysis rely on?

Conclusion (final answer, limitations, future work, why it matters)

Briefly summarize the project and directly answer the main research question.

Summary of Findings

- Restate our finding: What did the tests conclude (in plain english)
- Answer our research question directly
- Supporting findings: What did the exploratory analyses reveal

Limitations and Future Work

- Limitations: What are the weaknesses of our analysis? (most probably the correlation coefficient is not strong)
- Unanswered Questions: What remains unknown?
- Future research section
- Real-world meaning: So what? Why should anyone care about our findings?
